

Refilling the Buffer in a Storm

The Netherlands' countercyclical capital buffer, 0% → 2% (2022–2024)

[Speaker A] · [Speaker B]

October 2026

Country implementation of a CCyB increase

Frankfurt School of Finance & Management · MSc FinTech

The Netherlands filled its CCyB to 2% when the rulebook said 0% — refilling a buffer, not fighting a boom

Decision: CCyB 0% → 1% (ann. May 2022) → **2%** (ann. May 2023, binding 31 May 2024), together with lower O-SII buffers.

Puzzle: the Basel credit-to-GDP gap stood at **-33pp** and **-47pp** at the two decisions → the buffer guide implied **0%**.

Q1 · Environment

Recovered economy, then war, energy shock and **11.6%** inflation; ECB hikes from Jul-2022.

Credit cold; housing hot (+19% y/y), then falling.

Banks strong (CET1 17.7%) and more profitable as rates rose.

Q2 · Criteria & risks

DNB framework (2022): **2%** = “**standard risk environment**”, calibrated on past crisis losses (€12bn), not on credit growth.

Insures against shocks no indicator predicts; housing left to other tools.

Keeps the March-2020 promise to restore releasable capital.

Q3 · Implications

Cheap: ≤ about one fifth of big banks' CET1 headroom.

A swap: structural buffers cut in 2020 and 2024.

No sign of contraction in credit or its price. Complements ECB tightening; reciprocated abroad; **€6.7bn** releasable.

Verdict: **normalisation, not tightening.**

Trade-off: relies on discretion and credibility; release never tested.

When COVID hit, neighbours released their buffers — the Netherlands had nothing to release

Netherlands: CCyB 0% — nothing to release

DNB improvised (17 Mar 2020):

- cut systemic buffers of ING, Rabobank, ABN AMRO: 3% → 2.5 / 2 / 1.5%
- postponed the mortgage risk-weight floor
- **€8bn** freed, up to **€200bn** of lending

... and made a promise

"Once the situation is back to normal, DNB will compensate the systemic buffers reduction by gradually increasing the countercyclical capital buffer to 2%."

Design

- 0–2.5% of risk-weighted assets, on *domestic* exposures
- Increases bind after 12 months; releases are immediate
- EU reciprocity: foreign banks lending in NL hold it too

Why “releasable” matters

- In COVID, banks close to buffer thresholds **cut lending** even when *allowed* to use buffers (stigma, MDA)
- Only an explicitly **released** buffer is truly usable

DNB raised capital requirements in the middle of a storm, when its own rulebook said zero. Wrong moment?

The question

The storm (2022–23)

War in Ukraine · record energy prices
HICP inflation **11.6%** (2022)
ECB hikes from **21 Jul 2022**
House prices turning down
Basel gap **-33 / -47pp** → guide **0%**

The decision

CCyB **0% → 1% → 2%**
announced May 2022 and May 2023
binding May 2023 and May 2024

Raising capital in a downturn is the **procyclical mistake** the CCyB was invented to avoid.
Tightening into a slowdown? Fighting a hidden boom? Or something else?

The path to 2% was announced in 2020 — and walked step by step inside the ECB's tightening cycle

Q1 • Environment

Source: DNB press releases (17 Mar 2020; 27 May 2022; 31 May 2023; 17 Sep 2026; 24 Apr 2026); ESRB O-SII notifications (27 Nov 2020; 31 May 2023); ECB (21 Jul 2022; 14 Sep 2023).

The economy had fully recovered — then war, energy and inflation darkened the outlook

Q1 • Environment

after the invasion

DNB, Financial Stability Report, spring 2022

“After a strong recovery from the pandemic, the economic outlook has worsened due to the war in Ukraine and high inflation, and financial stability risks have increased.”

“Higher funding costs may put pressure on the debt sustainability of governments, businesses and households.”

By end-2021 the Dutch economy was almost 3% larger than at end-2019 — the recovery DNB's framework requires before building the buffer.

Housing: nominal prices +19% y/y (22Q1), real 16% above the 2007 peak. DNB itself: *“the overheated housing market calls for further measures.”*

Credit: household debt high (107% of GDP vs 58% in the euro area) but *falling*; debt service at its lowest since 2005.

Banks entered the storm well capitalised — and rising rates were lifting their profits

Q1 • Environment

17.7%

CET1 ratio, end-2021
(EU 15.7%, 21Q3)

16.3%

CET1 ratio, end-2022
“in line with EU average”

+6.7%

net interest income 2022
(67.7% of income)

11.5%

four major banks' CET1
after FSR-2023 stress (-3.8pp)

Against raising now

war and energy shock · 11.6% inflation
rapid ECB tightening · house prices turning

For raising now

economy recovered · credit cold
banks strong, profits rising with rates

DNB (FSR 2022): higher rates “*may ultimately have a positive impact on the profitability of financial institutions.*”

The Basel rule said 0% — but on Dutch data it had missed the last crisis and raised false alarms

Rule: gap < 2pp → 0%, gap > 10pp → 2.5%. Our one-sided HP filter ($\lambda = 400,000$) reproduces the official BIS gap within 0.00005pp (1971–2026).

Alternative trend filters are noisy around COVID (two-sided HP +4.2pp in 2021Q4) — one more reason not to trigger on any of them.

DNB's compass: 2% is the normal-times level, calibrated on past crisis losses — not on credit growth

built up 1pp a year → 2% after two years

- Criteria: a dashboard (macro, banks, households & firms, markets); *“no mechanical link ... guided discretion.”*
- 2% chosen *“also taking into account the impact of the buffer reduction in March 2020.”*
- Not alone: 17 jurisdictions run a positive neutral CCyB; NL, Sweden, UK, Poland target 2%. ECB loss-based range: 1.1–1.8%.

DNB justified the steps by recovery, uncertainty and its 2020 promise — not by credit growth

Q2 · Criteria & risks

May 2022 · 0% → 1%

*“When the systemic risk buffers ... were lowered in March 2020, we also announced our intention to **restore the buffers** by raising the CCyB.”*

“The risk profile is currently dominated by uncertainty caused by the war in Ukraine, but ... the robust economic recovery ... provides grounds for a gradual build-up.”

Cyclical risks: “normal” to elevated.

May 2023 · 1% → 2%

*“Although the credit-to-GDP gap shows **no signs of excessive credit growth**, some other indicators already point to higher cyclical risk.”*

Cited: investors' rising risk appetite · real-estate prices falling · debt sustainability of firms and governments · banks “robust, partly due to rising interest rates”.

Both decisions: **a normal-to-elevated risk picture + strong banks + the promise**. Credit growth is never the reason.

The CCyB insures against shocks nobody can forecast; the known hot spots got their own tools

Q2 · Criteria & risks

Financial-stability risks named by DNB (FSR 2022/23)

Instrument

War, energy and supply shocks · rapid tightening of financial conditions and market corrections · debt sustainability of governments, firms, households · bank turmoil abroad (SVB, Credit Suisse, 2023)

CCyB — releasable for *any* shock

“Overheated” housing · high mortgage debt of first-time buyers · interest-only loans

LTV/LTI limits, tax reform, **mortgage risk-weight floor** (Jan 2022 – Nov 2026)

Size and concentration of the large banks (sector **400%** → **280%** of GDP)

O-SII buffer (cut 2024)

Principle: one instrument per target (Tinbergen, 1952)

DNB on the 2020 recomposition: more releasable capital is “*a valuable addition given the sensitivity/volatility of the Dutch economy to external events.*” A releasable buffer is the only tool that works whatever the source of the shock.

If DNB were ...	normalising	fighting overheating	what happened	
Responding to credit indicators	no link	rises with them	gap, debt service, HH debt ratio <i>falling</i> ; CCyB <i>up</i>	✓
Path	+1pp a year, stop at 2%	follows risk	1% → 2% → held	✓
2023: house prices falling, rates jumping	raise anyway	pause	raised	✓
2024–26: house prices rising again (+10% y/y, Mar-26)	stay at 2%	go above 2% (phase 3)	held at 2%	✓
Other buffers	cut structural ones to compensate	keep them	cut in 2020 and 2024	✓

Five predictions, five matches: **normalisation**. The last row is the key to the whole story.

DNB's own words

"more or less capital-neutral for the three large banks" — 2020

"a limited increase in the net capital requirements" — Knot, Jun 2023

"slightly increases the capital requirements for the banking sector as a whole" — FSR 2023

Not unusual: the UK offset its 2% neutral CCyB by lowering Pillar 2A and resolution requirements.

Waterfall: approximate, own calculation. Buffer cuts valued at end-2022 total RWA of ING, Rabobank, ABN AMRO, de Volksbank (BNG excluded); CCyB amounts are DNB's sector-wide figures on Dutch exposures. Relative to 2021 the change was an increase.

The twist: the storm made it the cheapest moment — higher rates gave banks the profits to build the buffer

CET1 headroom above requirement / MDA, by bank

CCyB as share of headroom (upper bound)

Net interest income **+6.7%** in 2022 → banks build buffers from *retained earnings*, not by cutting loans. Headroom shrank because of RWA growth and payouts, not the CCyB.

ECB: gradual build-up + high profitability “limit these economic costs” (MPB 24); activating buffers during the 2022–23 tightening “can mitigate implementation costs” (MPB 31).

Not the wrong moment — arguably the right one.

Mortgage lending rate, NL minus controls (pp)

Household loan growth, NL minus controls (pp)

- Dutch lending rates stayed **inside the placebo range** at all three CCyB dates
- Household credit grew **faster** than in peers; bank credit 2022–26: NL +16.6% vs euro area +7.9% (but NL lagged in 2019–22: +4.3% vs +11.3%)

DNB (Sep 2026): “no signs of constraints in bank credit supply.”

One treated country, small control group (AT, FI, IT, MT, LU), housing rebound: **no sign of contraction**, not a causal estimate.

Building the buffer while the ECB hiked did not double the squeeze — it let monetary policy focus on inflation

Q3 · Implications

The concern

Two tightenings at once: ECB rates *and* capital requirements → credit crunch?

What the data show

Dutch lending rates did not diverge from euro-area peers (event study); bank profits *rose* with rates (net interest income +6.7%).

One monetary policy for the euro area, but national macroprudential policy: the CCyB is the **Dutch-specific lever** — and the insurance against a rate shock gone wrong.

ECB Macroprudential Bulletin 31 (2025)

Early CCyB activation “helps monetary policy focus on its primary objective of price stability, thereby largely eliminating the potential for conflict between price stability and financial stability.”

DNB, FSR 2022

“A sudden tightening of financial conditions could also have a negative impact on financial stability.”

Through reciprocity every bank lending in the Netherlands holds the 2% — and Europe is moving the same way

Q3 · Implications

Across borders

- Foreign banks with Dutch exposures must also hold the 2% (mandatory reciprocity up to 2.5%)
- Limits leakage to foreign lenders — a known problem with national capital tools (Aiyar, Calomiris & Wieladek, 2014); *non-bank* leakage remains
- In April 2023, 5 banking-union countries had positive-neutral frameworks; NL had the **highest** rate (2%)

CCyB increases in the euro area

Country	Rate	Applies from
Germany	0.75%	Feb 2023
France	1.0%	Jan 2024
Ireland	1.5%	Jun 2024
Netherlands	2.0%	May 2024
Belgium	1.0%	Oct 2024
Portugal	0.75%	Jan 2026
Spain	1.0%	Oct 2026

€0 → €6.7bn

releasable-by-design capital
2020 → 2024

≈ half

of the €12bn peak losses
after the GFC

€150bn

lending headroom
if released

Asymmetric payoff (Lang & Menno, 2023)

Normal times: +1pp requirement → about **-0.1%** lending.

Bad times: 1pp release → up to about **+10%** lending.

Cheap to hold, powerful to release.

A growing role

The mortgage risk-weight floor expires on 30 Nov 2026.
DNB: this “*underpins the importance of ... the current countercyclical capital buffer (CCyB) of 2%.*”

Credibility	Without a mechanical rule, markets must trust DNB's judgement and communication — the classic rules-vs-discretion trade-off (Kydland & Prescott, 1977).
Calibration	Why 2%, not 1.5%? The ECB's loss-based range is 1.1–1.8%; NL chose the top of the banking union.
Untested	No release yet: will banks lend the freed capital — or hoard it, as with usable buffers in COVID?
Baseline	Relative to 2021 (not 2019) it was an increase: +€3.3bn before the O-SII offset.
Same profits, two claims	The ECB lists the Netherlands among countries adopting bank levies on excess profits in 2022–23 — partly claiming the earnings that fund the buffer.

A promise kept: the buffer was refilled in the storm — at the moment it was cheapest

Q1 · Environment

Recovered economy hit by war, inflation and rate hikes; credit cold; housing hot, then cooling; strong, profitable banks.

Q2 · Criteria & risks

2% normal-times level, calibrated on past losses; insurance against unforeseeable shocks; housing to other tools; structural buffers cut in return.

Q3 · Implications

Cheap · largely a swap · no sign of contraction · complements monetary policy · reciprocated abroad · €6.7bn releasable · relies on discretion.

In March 2020, the Netherlands had nothing to release.
Next time, it will.

The best time to fill a buffer is when nobody thinks you need it — even in a storm.

Methods. Credit gap: one-sided (recursive) and two-sided HP filter, $\lambda = 400,000$, sample from 1961Q1; Hamilton (2018) regression filter, $h = 8, 20, p = 4$. Headroom: (CET1 ratio – CET1 requirement/MDA) $\times$ total RWA per bank; CCyB amount sector-wide (upper bound); 6–47% assumption grid as sensitivity. Event study: two-way FE, NL $\times$ 3-month event-time bins, country and month FE; placebo inference over controls with no CCyB change 2021–25. Code and data: GitHub repository (code/, data/).
